User Manual v1.0

A Letter to the Trader

You did not come this far to guess.

Every trader who has ever sat in front of a screen, watched a candle form, and asked themselves 'is this real or a trap?' — knows the feeling. The market speaks. The question has always been: do you know the language?

VSABlueprint was built for the trader who is done with hope-based trading. It brings to your chart the same principles that institutional traders have used for decades — Volume Spread Analysis — and layers it with a precision Volume Profile so you always know where the real money spent its time.

This tool does not predict the future. Nothing does. What it does is reveal **what is actually happening** in the market, bar by bar, so you can make decisions based on evidence — not noise.

Trade with clarity. Trade with conviction. Trade with VSABlueprint.

— **The VOFA Team**

Chapter 1 — What is VSABlueprint?

VSABlueprint is a professional-grade NinjaTrader 8 indicator that brings together **Volume Spread Analysis (VSA)** and a **Session Volume Profile** into one seamlessly integrated tool — giving you a complete picture of market activity on a single chart.

Most traders look at price alone. VSABlueprint adds the critical missing dimension: **volume**. Where was volume concentrated? When the market moved, did volume support that move — or contradict it? These are the questions that separate guessing from knowing.

The Philosophy: Every bar on your chart tells a story. VSABlueprint reads the relationship between the *spread of each bar*, the *closing position*, and the *volume* — and translates that relationship into clear, actionable signals. No lag. No repainting. Pure price-volume truth.

What Makes It Different

Institutional Logic	Built on the same VSA principles used by professional traders and smart money operators.
Volume Profile Integration	Automatically plots session Volume Profile, VPOC, Value Area High and Low — revealing where real price acceptance occurred.
Context-Aware Signals	Every signal dot knows where it is. Is it near a key level? Near a yellow line? Near yesterday's VPOC? The tool factors all of this in.
Interactive Insight	Click any signal dot and a detailed popup explains exactly what the signal means, what to watch for, and how to act.
Zero-Clutter Design	VSA Only Mode hides the Volume Profile so you get clean bar analysis without distraction.

Chapter 2 — The Two Core Engines

Volume Spread Analysis (VSA)

VSA reads the relationship between three elements on every bar: the **spread** (high minus low), the **closing position** within that spread, and the **volume**. When these three agree — the market is speaking clearly. When they contradict each other — someone large is hiding their hand.

VSABlueprint detects those contradictions automatically and marks them with color-coded bars and signal dots so you never miss a professional footprint.

Session Volume Profile

The Volume Profile shows you *where* volume actually traded during each session. The **VPOC** (Volume Point of Control) is the price level that attracted the most volume — a magnet that price repeatedly returns to.

The **Value Area** (VAH + VAL) marks the range where 68% of volume occurred. When price trades *outside* this area, it is telling you something important about acceptance or rejection of current prices.

When a VSA signal forms *at* a VPOC, VAH, or VAL level from a previous session, the probability of a meaningful market reaction increases substantially. VSABlueprint tracks this automatically — the Insight Dialogue Box will highlight the confluence whenever it is detected.

Level	What It Means	Why It Matters
VPOC	Volume Point of Control <i>The busiest price level of the session.</i>	Acts as a magnet. Price tends to return to this level repeatedly across sessions.
VAH	Value Area High <i>Top boundary of the 68% volume range.</i>	Acts as resistance when approached from below. Watch for rejection signals here.
VAL	Value Area Low <i>Bottom boundary of the 68% volume range.</i>	Acts as support when approached from above. Watch for absorption signals here.

Chapter 3 — Bar Colors: Reading the Market

VSABlueprint colors each bar to instantly communicate the character of that bar's activity. At a glance, you know whether professionals were active, whether volume was extraordinary, and whether the move was supported or hollow.

BLUE — Ultra High Volume

A Blue bar represents the highest level of volume activity — significantly above the recent average. This is where institutions move. These bars leave footprints that become key reference levels. When a Blue bar closes in the upper half, strong hands absorbed supply. When it closes weak, they were distributing. The Yellow Line is drawn at the high of the first Blue bar of each session.

PURPLE — Elevated Volume

Purple bars show notably elevated volume — not quite at the Blue threshold, but above the norm. These bars often precede or confirm major moves. They mark locations where the volume story changed.

PALE VIOLET RED — EVR Bar (Effort vs Result)

The price moved, but volume surged beyond what the price movement justified. Effort and result are out of sync. This is the classic hidden-hand signal — professionals absorbing or distributing quietly into a bar that looks ordinary on price alone.

YELLOW — Ninja Pattern (Retracement Bar)

A large directional bar followed immediately by a controlled retracement bar — narrow spread, within the range of the prior bar. This signals a pause, not a reversal. The dominant force is resting before continuing.

GRAY — Decreasing Volume

Volume declining across three consecutive bars. The force behind the move is fading. Gray bars are often found at turning points — the energy has simply run out.

DEFAULT — Standard Bars

Normal bars without special volume or spread characteristics. The baseline of market activity.

Note on Bar Coloring Mode: VSABlueprint offers two modes. **VSA Mode** colors bars according to all the patterns described above. **Standard Mode** shows only classic red/green bars — useful when you want signals and dots without bar-level coloring.

Chapter 4 — The Signal Dots

Signal dots appear above or below bars to mark specific VSA conditions. Each dot has a precise meaning. A dot above a bar is bearish context. A dot below a bar is bullish context. Click any dot to open the Insight Dialogue Box.

Below bar

BLUE DOT — Supply Test

Price tested lower and found no sellers. The market absorbed available supply and closed strong. A strong version of this signal forms at a fresh session low — the most powerful confirmation that supply is absent.

Above bar

HOT PINK DOT — No Demand

An up-move with no professional participation behind it. Volume was declining and spread was narrow. This hollow advance is a warning — the rally has no backing.

Below bar

DODGER BLUE DOT — No Supply

A down-move with no sellers present. Volume dried up completely on a new low. The path of least resistance is reversing upward.

Below bar

TURQUOISE DOT — Stopping Volume

High volume during a downtrend that closes in the upper half of the bar. Smart money is absorbing the panic selling. The decline is being arrested.

Below bar

GREEN DOT — Selling Climax

Panic selling at ultra-high volume at a fresh low. Professionals are quietly buying everything the public is throwing away. Classic exhaustion signal.

Above bar

SADDLE BROWN DOT — Buying Climax

Euphoric buying at ultra-high volume at a fresh high. Professionals are quietly distributing to the excited public. Classic distribution exhaustion signal.

Above bar

ORANGE RED DOT — Upthrust

Price probed above the prior bar's high on wide spread but closed back down. A deliberate move to catch stops and trap late longs before a decline.

Above bar

DARK ORANGE DOT — Pseudo Upthrust

A subtler upthrust. The prior bar was strong, but this bar's attempt higher failed. Professionals are quietly distributing into the enthusiasm.

Above/Below

YELLOW DOT — EVR Fresh High/Low

A PaleVioletRed (EVR) bar formed at a fresh session high or low. Volume surged but price failed to extend meaningfully — a strong reversal warning.

Below bar

GREEN DOT (BBA) — Blue Bar Absorption

A two-bar pattern: a wide Blue bar followed by a narrow bar that probes the low but cannot extend it. Supply tested the Blue bar's hold — and failed.

Below bar

WHITE DOT — Shakeout

A deliberate engineered move to flush weak longs before the real move higher. Price breaks a prior low then recovers, catching sellers offside.

Chapter 5 — Trade Signals

When VSABlueprint identifies a high-probability trade setup, it places a **"Trade"** label on the chart. These are not random signals — each one requires multiple conditions to align simultaneously. Click the label to open the full Insight Dialogue Box with entry, stop, and target levels.

Trade labels appear in two colors:

Green "Trade" label — BUY setup. The indicator has identified bullish conditions aligned with a key price level.

Red "Trade" label — SELL setup. The indicator has identified bearish conditions aligned with a key price level.

The Trade Setups

BUY

Session Open Pattern (SOP)

A powerful wide Blue or Purple opening bar followed by a controlled second bar that pulls back but holds firm. The professionals announced their presence at the open — this is your invitation to join them.

BUY

Cyan Session Open Pattern (CSOP)

A Blue opening bar that touches and respects a key horizontal level, closing above it convincingly. The bar that follows confirms the hold. Professionals used the open to test the level — and the test passed.

BUY

Supply Test at Line (STLine)

A supply test bar that forms exactly at a horizontal reference level — Yellow Line, Support Line, Session Line, or Gap Line — and closes above it. This is the highest-conviction version of the supply test signal.

BUY

Bar 1 / Bar 2 Candidate Setup

A special high-volume bar touches a horizontal line from above (Bar 1), and the very next bar confirms the hold with a narrow close (Bar 2). Two-bar confirmation at a level. Professionals defending a known price.

BUY

SC + Supply Test (SC+ST)

A Selling Climax followed by a Supply Test within two bars. The climax absorbed the panic — the supply test confirmed sellers are gone. One of the most reliable VSA accumulation sequences.

BUY

Blue Bar Yellow Line Supply Test (BBYLST)

Within the same session, a Blue bar creates a Yellow Line. A subsequent supply test bar dips through that line and closes above it. The institutional level held exactly as intended.

BUY**Gray Bar Supply Test**

A supply test bar that is also a Gray bar — almost no volume. Sellers had one last chance to push price lower and showed up with nothing. The highest conviction version of supply exhaustion.

BUY**No Supply at VA Level (NSVA)**

A No Supply bar that touches a key horizontal level, followed by a bar that closes higher without any bearish dots. Supply at the level is completely absent. The market is ready to move.

SELL**Opening Bar Resistance (OBR)**

A Blue or Purple opening bar that touches a resistance level from below but closes below or at it. The second bar confirms the rejection with a bearish dot. Professionals tested resistance and decided not to break it.

SELL**BC + Weakness (BC+Weak)**

A Buying Climax followed by an upthrust, pseudo-upthrust, or No Demand bar within two bars. The climax distributed the position — the weakness bar confirmed buyers are now gone.

SELL**Zone Resistance Sell (ZRS)**

On the first bar of a new session, a Zone or Yellow Line rejection dot forms. The next bar also shows weakness. Two consecutive rejections at a resistance level in the opening session bars.

SELL**Blue/Purple + 2-Bar Weakness (PBW)**

A Blue or Purple opening bar (Bar 1), followed by two consecutive bars with bearish dots. Three bars of weakness starting from an institutional volume bar — a sustained distribution sequence.

SELL**Session Open Yellow Line Rejection (SOYLR)**

A powerful opening bar that touches a key level from above but fails to close above it. The very next bar shows a bearish dot. Rejection at resistance confirmed across two bars.

SELL**SC + Yellow Bar (SC+YB)**

A Selling Climax immediately followed by a Yellow bar retracement. The climax found buyers — the Yellow bar is the controlled pause before price returns to test the climax high as a bullish target.

Chapter 6 — The Insight Dialogue Box

The Insight Dialogue Box is VSABlueprint's most powerful interactive feature. It turns every dot and Trade label on your chart into a **live trade briefing**.

How to Open It: Simply **left-click** on any signal dot or Trade label on the chart. A popup window opens instantly with full details about that signal. Click anywhere on the chart to close it — or it closes automatically when it loses focus.

What the Dialogue Box Shows You

■ Signal Identity	The name of the signal, the instrument, the timeframe, and the exact time the bar formed — so you always know what you are looking at and when.
■ What This Means	A plain-English explanation of what the signal is telling you about market structure — no jargon, no formulas. Just the story behind the bar.
■ Signal Context Grid	A four-cell grid showing the key characteristics of the signal: volume character, spread response, market message, and directional bias.
■ Confluence Detection	If the signal formed near a previous session's VPOC, VAH, or VAL, the box highlights this automatically with a prominent amber warning. Confluence at a Value Area level means the signal carries substantially higher probability. This is the edge within the edge.
■ What to Watch For	Specific, numbered confirmation steps to look for in the bars that follow. What confirms the signal? What cancels it? What makes it stronger? The dialogue box gives you a complete decision framework.
■ Trade Levels	For Trade label signals, the dialogue box shows the exact Entry price , Stop Loss , Target , and Risk:Reward ratio in ticks and price — everything you need to place the trade immediately.
■ Entry Instructions	A color-coded instruction box — green for buys, red for sells — with a concise, numbered entry sequence. Open the box. Read the instruction. Execute with confidence.

The dialogue box closes automatically the moment you click anywhere on the chart — keeping your workflow fast and your screen clean.

Chapter 7 — Lines & Zones

VSABlueprint automatically draws and manages horizontal reference levels on your chart. These lines are not arbitrary — each one is rooted in a specific market event that caused a measurable structural shift. Together they form the **price memory** of your chart — the levels where institutions have acted before and are likely to act again.

Yellow Lines (FSYBHL)

Drawn at the high of the **first Blue bar** of each session. The first time institutional volume appears in a session sets the tone. The Yellow Line marks that moment. When price returns to this level from above and holds — or approaches it from below and rejects — it is a high-significance event. Yellow Line breach dots mark these interactions.

Support Lines

Automatically drawn when price makes a fresh multi-session low and then rallies significantly away from it. These lines extend forward until price returns and touches them. When touched, they produce a Support dot. Line color inherits from the bar that formed the low — Indigo, PaleVioletRed, or Orange lines indicate the level was created by a special-character bar.

Resistance Lines

Drawn at fresh multi-session highs after a significant pullback. They extend forward until price returns and tests them. When touched, a Resistance dot appears. Like Support Lines, these inherit the color of their originating bar.

Gap Lines

When a session opens with a meaningful price gap, VSABlueprint draws lines at the prior session's high and low — the edges of the gap rectangle. These levels represent unfilled business. Price frequently returns to close gaps. When it does, the lines stop extending.

Session Lines (White Dashed)

Generated from end-of-session two-bar patterns that signal potential directional intent for the following session. These white dashed lines extend into the next session. If that session opens eligible and price touches the line — a BUY or SELL alert fires.

Zones (Gray / Orange)

Created by wide-spread, high-volume bars. The zone captures the range between the close and the extreme of that bar. Initially gray, zones change to orange when price revisits them — confirming the level is still being defended by the same institutional interest.

Chapter 8 — Alerts & Market Analyzer

VSABlueprint is fully integrated with NinjaTrader's Alert and Market Analyzer systems. You never need to watch every chart simultaneously — the indicator watches for you.

Alerts

Every signal fires a NinjaTrader alert with a descriptive message. The alert includes the instrument name, timeframe, signal type, and — for trade signals — the full entry, stop, and target levels. Alerts play a sound and display in the NinjaTrader Alert window for your review. Enable or disable alerts from the indicator settings.

Market Analyzer Integration

Add VSABlueprint to a Market Analyzer column and watch the **SignalAlert** value. Each signal type outputs a unique numeric value — making it trivial to scan an entire watchlist and immediately see which instruments are showing active signals. Positive values indicate bullish signals; negative values indicate bearish signals.

Value	Signal	Direction
1	Blue Bar (Ultra High Volume)	Bullish context
2	Strong Supply Test	BUY
3	No Supply	BUY
4	No Demand	SELL
5	Selling Climax	BUY
6	Buying Climax	SELL
7	Stopping Volume	BUY
8	Upthrust	SELL
9	Pseudo Upthrust	SELL
11	Blue Bar Absorption	BUY
14/15	EVR Fresh High / Fresh Low	Reversal
±100+	Trade Signal (various methods)	BUY (+) / SELL (-)

Chapter 9 — Display Settings

VSA Only Mode	<i>ON / OFF</i>	When ON, hides all Volume Profile visualisation and shows only VSA bar coloring, signal dots, trade labels, lines, and zones. Recommended for clean intraday analysis. When OFF, the full Volume Profile is visible alongside all VSA features.
Bar Coloring Mode	<i>VSA / Standard</i>	VSA: colors bars according to volume and spread analysis (Blue, Purple, Yellow, Gray, PaleVioletRed). Standard: shows traditional red/green bars. Signals and dots work in both modes.
Show Signals on Chart	<i>ON / OFF</i>	Controls whether Trade labels and signal dots appear on the price chart. Turn OFF if using VSABlueprint only in the Market Analyzer.
Enable Alerts	<i>ON / OFF</i>	Master switch for all NinjaTrader alerts fired by VSABlueprint.
Profile Width %	<i>10 – 100</i>	Controls how wide the Volume Profile bars extend across the session range. 30% is a clean default that does not obscure price action.
Value Area %	<i>50 – 100</i>	The percentage of total session volume that defines the Value Area. 68% is the standard — one standard deviation of activity.
Bucket Size (Ticks)	<i>1 – 100</i>	The price granularity of each Volume Profile level. Larger values produce fewer, wider levels. Smaller values produce fine-grained profiles.
Profile Placement	<i>0 = Left, 1 = Right</i>	Whether Volume Profile bars draw to the right or left of the session range.
Zone Transparency	<i>0 – 100</i>	Controls the opacity of Zone rectangles on the chart. 15 is the default — visible but not obstructive.
Show Trade Messages	<i>ON / OFF</i>	When ON, Session Line trade messages display on the chart at the bar where they trigger.

Chapter 10 — Quick Reference

All Signals at a Glance

Dot / Label	Color	Position	Meaning	Bias
Supply Test	Blue	Below	No sellers present	Bullish
No Demand	Hot Pink	Above	Up-move without support	Bearish
No Supply	Dodger Blue	Below	Down-move without sellers	Bullish
Stopping Volume	Turquoise	Below	Absorption of panic selling	Bullish
Selling Climax	Green	Below	Exhaustion of sellers	Bullish
Buying Climax	Saddle Brown	Above	Exhaustion of buyers	Bearish
Upthrust	Orange Red	Above	Failed probe above resistance	Bearish
Pseudo Upthrust	Dark Orange	Above	Subtle failure at high	Bearish
EVR (Yellow Dot)	Yellow	Above/Below	Volume-spread contradiction	Reversal
BBA (Green Dot)	Green	Below	Blue bar absorption confirmed	Bullish
Shakeout (White Dot)	White	Below	Weak hands flushed	Bullish
YL Support	Green	Below	Yellow Line held as support	Bullish
YL Resistance	Red	Above	Yellow Line rejected advance	Bearish
Zone Support	Green	Below	Zone held as support	Bullish
Zone Resistance	Red	Above	Zone rejected advance	Bearish
Trade BUY	Lime Text	Below	Full multi-condition setup	BUY
Trade SELL	Red Text	Above	Full multi-condition setup	SELL

"A signal at a key level is worth ten signals in empty space."

When VSABlueprint signals align with a VPOC, VAH, VAL, Yellow Line, Support Line, Resistance Line, or Zone — that is where the market's truth lives. Those are the moments worth acting on.

Trade with Clarity. Trade with Evidence. Trade with VSABlueprint.

VSABlueprint is not just an indicator. It is a framework for reading markets the way institutions read them — through volume, spread, and context. Every bar, every dot, every line is a clue. You now have the tools to read them all.

The market will always leave footprints. Now you know exactly where to look.
